1 Course Introduction

1.1 Lecture Series Overview

2 Introduction to C++

2.1 Why C++?

2.2 Evolution of C++

2.3 C++ vs. Other Languages

3 Environment Setup

3.1 Tools Required

3.1.1 Text Editor

- What is a text editor? A tool that edits text. `// duh`
- **Text Editor vs. IDE:** A text editor is a basic tool for writing plain text. An IDE (Integrated Development Environment) is a more comprehensive tool that includes debug software, build automation, and autocompletion.
- Some popular text editors include:
 - **Visual Studio Code:** A very popular and free IDE with support for C++ through extensions.
 - **CLion:** An IDE built specifically for C and C++ with many advanced features.
 - **Vim:** My personal choice. Incredibly powerful with a steep learning curve. Requires more setup and configuration.

3.1.2 Compiler

- **Definition:** The compiler converts your C++ source code into machine-readable instructions.
- Common C++ compilers include:
 - **clang:** My personal favorite, known for diagnostics.
 - **gcc:** The GNU Compiler Collection, a very popular compiler.
 - **MSVC:** An increasingly irrelevant piece of garbage.
- Throughout the lecture series, I will be using **clang**. If a certain clang flag or directive does not work for your compiler, simply look up its equivalent.

3.2 Install Instructions

The following links direct you to the best VSCode for C++ installation articles I could find. Choose the tutorial that corresponds to your operating system, if wanting to use VSCode:

- MacOS
- Windows
- Linux

3.3 "Hello, World!" Example
